of the capsule jacket assembly 53 is loosened to allow movement of the capsule jacket main sheath 160. While using one hand to firmly grasp the ipsilateral capsule catheter assembly 52 and hold it stationary, the physician grasps the sheath adapter 164 with the other hand and gently pulls the sheath adapter proximally towards the capsule catheter wye adapter 145. Simultaneously, the physician applies slight tension on the guiding tube assembly 205 from the contralateral side as it is removed from the capsule jacket assembly. The capsule jacket assembly is gradually retracted to sufficiently expose the proximal capsule 132 to free the contralateral capsule 202. The capsule jacket assembly is then moved to its most proximal position and its proximal end 162 is locked to the male component 154 of the ipsilateral capsule handle 145. The locking ring is then tightened to hold the capsule jacket assembly in place, as shown in FIG. 29. The radiopaque marker 166 at the distal end of the capsule jacket main sheath may be used to position the capsule jacket as desired. Moreover, the position of the distal capsule 93 relative to the proximal capsule 132 is adjusted by using the marker bands on the hypotube 115 to adjust the graft 55 length to physiologic length.

At this point in the procedure, the contralateral tubular leg 172 of the graft 55 is moved into the contralateral iliac artery 229 by pulling the guiding tube 206 in a proximal direction, as shown in FIG. 30.
